

ABSTRACT OF DISCLOSURE

The invention relates to a hollow molded part with a closed cross-section and a reinforcement, wherein the hollow molded part is formed as a single piece and exhibits a blank mold,

-with the first region (1) with a first starting outer diameter (D1) and the starting wall thickness (b1), and

-at least a second region (2) with an outer diameter reducing in comparison to the starting outer diameter (D1) and having an increased wall thickness in comparison to the starting wall thickness (b1), wherein the increased wall thickness forms a reinforcement. (Figure 2).
